online without permission.

124

Psychology 402 - Spring 2022 - Dr. Michael Diehr

$$S = \sqrt{\frac{\sum_{i=1}^N (x_i - \bar{x})^2}{N - 1}}$$

127

Psychology 402 - Spring 2022 - Dr. Michael Diehr

## Measurement & Stats

- Why numbers?
- Distribution & Graphs : Histogram
- Central Tendency
- Mean, SoR, SSR, Variance, Standard Deviation
- In-class exercise
- Population vs. Sample
- Measurement Scales
- Precision vs. Accuracy
- Logic and Logical Fallacies Descriptive vs. Inferential Statistics
- Norms

128

Psychology 402 - Spring 2022 - Dr. Michael Diehr

## Basic Statistics

- Why use numbers?
- Pros:
  - convenient, succinct
  - universal
  - well-defined, repeatable
- Cons:
  - precision vs. accuracy
  - numerical fallacy

129

Psychology 402 - Spring 2022 - Dr. Michael Diehr

## Tabular Data

**Table 1:**

*San Diego Annual Rainfall (in Inches) by Year*

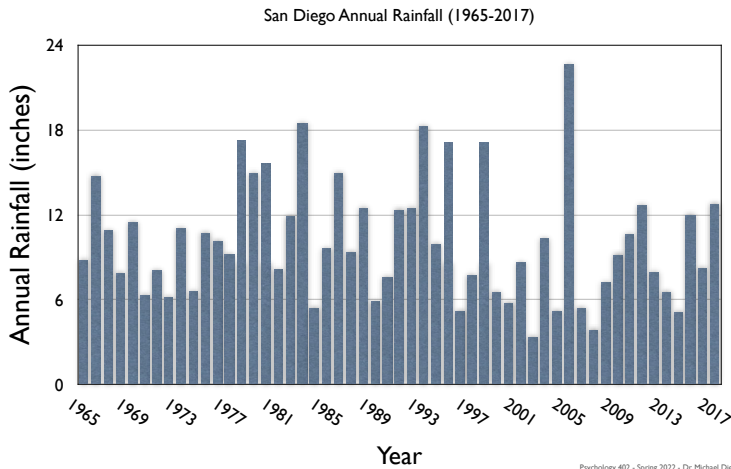

Year	Rainfall (inches)
1965	8.81
1966	14.76
1967	10.86
1968	7.86
1969	11.48

130

Psychology 402 - Spring 2022 - Dr. Michael Diehr

# Data Distributions

131

# Histogram

- Frequency Distribution
- Invented by Karl Pearson
- Shows data from *one* variable only
- Data is (often) collected into groups (“bins”)

132

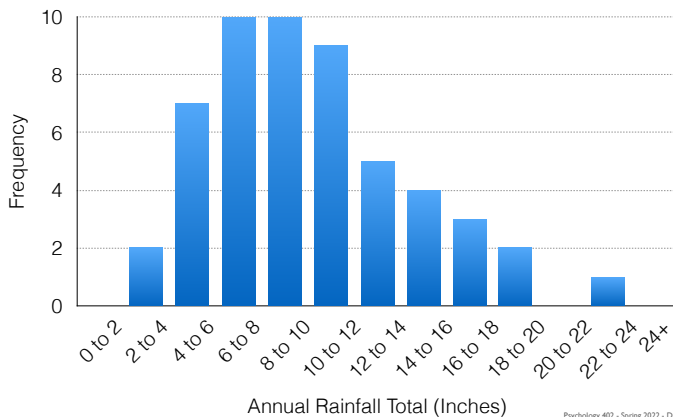

Psychology 402 - Spring 2022 - Dr. Michael Dohr

# Histogram

133

**Figure 1**

*Frequency Distribution of San Diego Annual Rainfall*

# Describing Distributions

- Why? Large lists are inconvenient. Reduce many data points to a few numbers.
- Issue: Reducing data (“Degrees of freedom”) : throws away data.
- We are modeling our data using a simplification.
- “All models are wrong, some models are useful”
- Simple vs. Simplistic?

134

Psychology 402 - Spring 2022 - Dr. Michael Dohr

# Descriptive Statistics

- Statistical Assumptions: When these are not met, weird things happen.
- Joe Smith is 6 feet tall, his child is 1 foot tall. Thus, the average height in the Smith household is 3.5 feet.
- If you are sitting in bar, and Bill Gates walks in, suddenly everyone in the bar is (on average) a multi-millionaire.

135

Psychology 402 - Spring 2022 - Dr. Michael Dohr

# Alternative Notations

- Square Root (x)  $\text{sqrt}(X)$   $\sqrt{X}$   $\sqrt[2]{X}$
- X-Squared  $X^2$   $X^{**2}$   $X^2$
- Sum(x)  $X_1+X_2+X_3...$   $\sum_{i=1}^N x_i$   $\sum x$
- Mean  $M$   $\frac{\sum x}{N}$   $\bar{X}$

136

Psychology 402 - Spring 2022 - Dr. Michael Dohr

# Central Tendencies

- Values tend to cluster around a point.
- **Mean** : most common statistic, commonly referred to as the “average”. Formula  $\sum X / N$
- **Mode**: the most common value in a set
  - rare to use in statistics
- **Median**: the middle-most value in a set
  - the value at which half are above and half are below. Aka the 50th percentile.

137

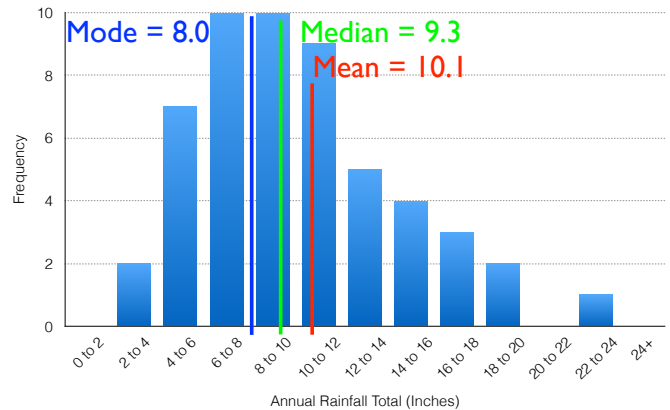

Psychology 402 - Spring 2022 - Dr. Michael Dohr

# Histogram

138

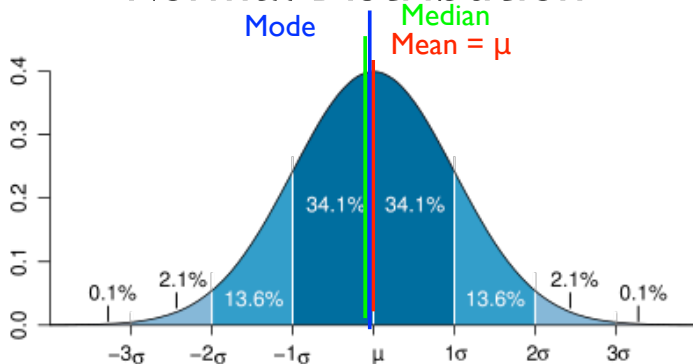

**Figure 1**

*Frequency Distribution of San Diego Annual Rainfall*

Psychology 402 - Spring 2022 - Dr. Michael Dohr

# Normal Distribution

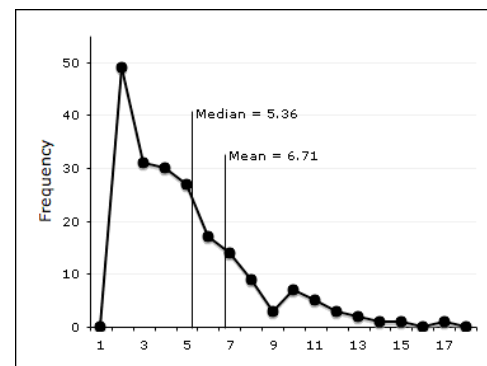

In a normal distribution, the mean, mode, and median are all the same

139

Psychology 402 - Spring 2022 - Dr. Michael Dohr

# Skewed Distribution

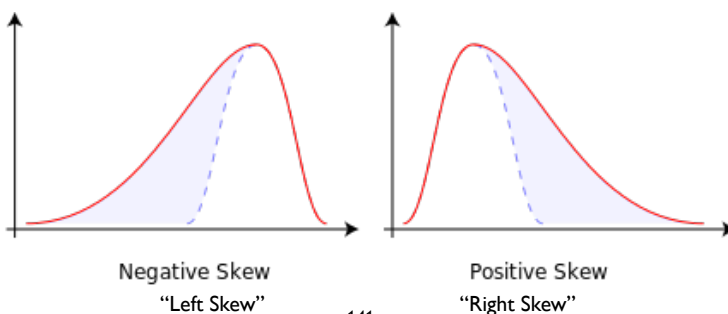

In a skewed distribution, the mean, mode, and median are all often different

Psychology 402 - Spring 2022 - Dr. Michael Dohr

# Skew

- negative skew : fatter tail on the left
- positive skew : fatter tail on the right

141

Psychology 402 - Spring 2022 - Dr. Michael Dohr

# Measures of Central Tendency 1

	Description	Algorithm	Formula
<b>Mean</b>	the “average”	sum values, divide by N	$\bar{x} = \frac{\sum_{i=1}^N x_i}{N}$
<b>Median</b>	the “middle-most value”	sort values, find middle value	50th percentile
<b>Mode</b>	the “most common” value	find most frequent value	...

142

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Measures of Central Tendency 2

Behavior:	Normal Distribution	Skewed Distribution
Mean	same	overly affected by outliers
Median	same	fairly resistant to outliers
Mode	same	resistant to outliers

143

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Measures of Dispersion 1

- Compare each measured value to the average
- “for a typical value, how far away is it from the mean”
- “Difference score” or “residual” can be calculated as the difference between the actual score and the mean. In other words,  $d_i = x_i - \bar{X}$
- Take the average (mean) of the difference scores.
- Average difference score =  $\text{Sum}(d) / N$

145

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Average Difference Score

146

	Score (x)	Mean ( $\bar{X}$ )	Difference $d = (x - \bar{X})$
	2	6	-4
	3	6	-3
	9	6	3
	11	6	5
	14	6	8
	1	6	-5
	6	6	0
	4	6	-2
	5	6	-1
	5	6	-1
Sum	60	60	0
Mean	6	6	0

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Sum of Residuals

- Given N samples of x :  $x_1, x_2, x_3 \dots x_N$

- mean of x 
$$\bar{x} = \frac{\sum_{i=1}^N x_i}{N}$$

- residuals 
$$d_i = x_i - \bar{x}$$

- Sum of Residuals is always zero

$$\sum_{i=1}^N d_i = 0$$

147

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Sum of Residuals

- The “average difference score” score will *always* equal zero
- Solution:
  - Square the residuals *before* adding: removes the negative values.
  - “SSR” or Sum of Squared Residuals

148

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## SSR: Sum of Squared Residuals <sup>149</sup>

- Given N samples of X:  $x_1, x_2, x_3 \dots x_N$

- mean of x 
$$\bar{x} = \frac{\sum_{i=1}^N x_i}{N}$$

- residuals 
$$d_i = x_i - \bar{x}$$

- Sum of Squared Residuals (SSR)

$$SSR = \sum_{i=1}^N (d_i)^2$$

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Problems with SSR

- SSR depends on units of measurement:
  - a meter is 1000 millimeters, so SSR will be  $1000 \times 1000 =$  one million times higher when using meters vs. millimeters
- SSR depends on N (# of samples)
  - Doubling N will cause SSR to double (roughly)
- Therefore, SSR is hard to understand:
  - is SSR = 0.00342 high or low?
  - is SSR = 2343249 high or low?

150

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Remove the influence of N

- The Sum of a set of values depends on the number (N) of values:
  - $\sum_{i=1}^N x_i$
- Take the average (mean)
  - this divides by N
  - removes the influence of N

151

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Variance

- Problem: SSR depends on N
- Solution: Take the average of SSR to remove the influence of N
- The average of the squared residuals is called Variance ( $S^2$ )

152

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Variance

- Variance = SSR/N
- Variance = mean of squared residuals

$$S^2 = \frac{\sum_{i=1}^N (d_i)^2}{N}$$

$$S^2 = \frac{\sum_{i=1}^N (x_i - \bar{x})^2}{N}$$

153

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Problems with Variance

- Units are squared:
  - measuring height in meters? variance is meters<sup>2</sup>
  - measuring # of cupcakes eaten? variance is (# of cupcakes eaten)<sup>2</sup>
- Won't someone rid me of these meddlesome squared units?

154

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Standard Deviation

- Improving on Variance:
  - The square root of Variance ( $S^2$ ) gives S, which is called "Standard Deviation".
  - Also abbreviated SD, StdDev or  $\sigma$  (Greek letter sigma), or sometimes just "S"
  - SD : easier to understand because it's in the same units as your measurement.
- SD is a unique property of the normal distribution -- given a mean and a SD you have uniquely specified the distribution

155

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Standard Deviation

- SD = Square root of Variance

$$S = \sqrt{\frac{\sum_{i=1}^N (d_i)^2}{N}}$$

$$S = \sqrt{\frac{\sum_{i=1}^N (x_i - \bar{x})^2}{N}}$$

156

Psychology 402 - Spring 2022 - Dr. Michael Dohr

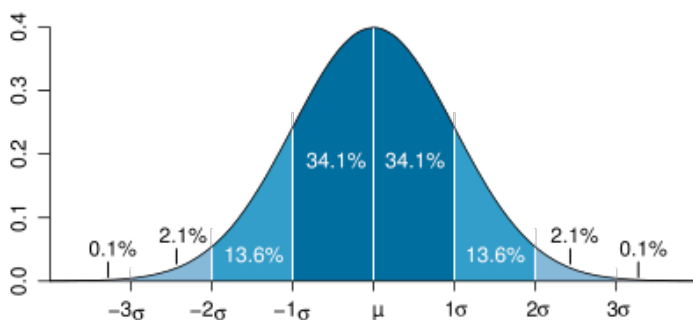

## Standard Deviation

- can be thought of as the “average deviation”
- (but it’s not literally average deviation, since we showed earlier the average difference score is always Zero)
- Technically:
  - (in a normal distribution) scores will be within plus or minus 1 SD about 68% of the time

157

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Normal Distribution

In a normal distribution, about 68.2% of values fall within  $\pm 1$  SD

158

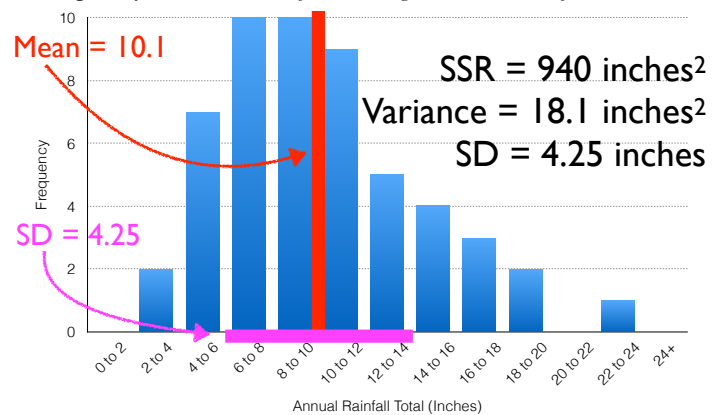

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## SSR, Variance and SD

159

Figure 1

Frequency Distribution of San Diego Annual Rainfall

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Central Limit Theorem

- No matter the shape of the Population distribution, if you take enough (\*) samples of the mean, the distribution of your samples of the mean will have a Normal distribution
- Central Limit Theorem Exercise (Javascript)
- This fact makes our life easy: Many statistics assume a normal distribution. The CLT provides us a normal distribution in most cases, even when the population data is skewed

160

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Exercise: normal distribution

- Roll one 10-sided die 10 times and record the results
- Prediction
  - Your Distribution: Uniform (flat)
  - Mean : 4.5
  - Class Distribution: ???
- hint: What is N? # die rolls, # of students?
- List and Graph results
- Does the distribution look normal?
  - if so, why?

161

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Exercise I: Die Rolls

Trial #	X	M	d = (x <sub>i</sub> - M)	(residual) <sup>2</sup>
1	2	3.5	-1.5	2.25
2	4	3.5	0.5	0.25
3	6	3.5	2.5	6.25
4	2	3.5	-1.5	2.25
Sum:	14			

N # of rolls	M = $\bar{X}$		$\Sigma$ Residuals	$\Sigma$ (residual <sup>2</sup> )	$\frac{\Sigma (\text{residual}^2)}{N-1}$	$r_s^2$
4	3.5		0.0	11.0	3.67	1.92

162

Psychology 402 - Spring 2022 - Dr. Michael Dohr

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Example of APA-7 style Histogram

**Figure 1**

Frequency Distribution of Annual Rainfall in San Diego

164

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Ch. 2 - Part 2

169

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Review - Stats

- Why Numbers?
  - pros
  - cons
- Distributions
  - Tables
  - Graphs

175

Psychology 402 - Spring 2022 - Dr. Michael Dohr

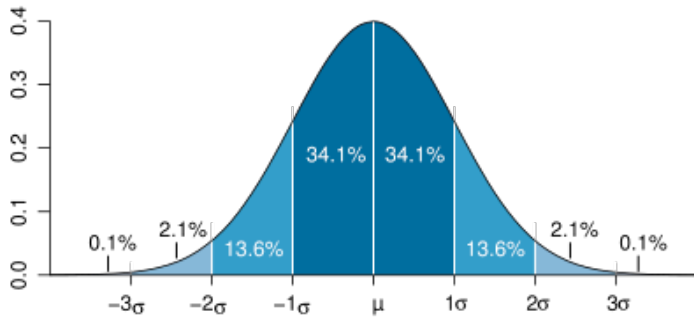

## Review - Descriptives

- Frequency Distribution aka Histogram
  - graphically shows data
- Central Tendency
  - mean, median, mode
- Dispersion or Variation
  - residual
  - sum of residuals = 0
  - sum of squared residuals > 0
  - SSR/N = Variance
  - Sqrt(Variance) = Standard Deviation

176

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Review : Distributions

In a normal distribution, about 68.2% of values fall within  $\pm 1$  SD

179

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Standard Deviation

- SD = Square root of Variance

$$S = \sqrt{\frac{\sum_{i=1}^N (d_i)^2}{N}}$$

$$S = \sqrt{\frac{\sum_{i=1}^N (x_i - \bar{x})^2}{N}}$$

180

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Exercise: key points

- Some events (such as the roll of a die) have a flat (or 'uniform') distribution, but these are rare.
- Many big events are composed of many small events.
- Events in the real world often are distributed in a (nearly) normal distribution
- Assuming a normal distribution, the easiest way to describe the data is by two factors: Mean and SD.

181

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Types of Statistics

- Descriptive:
  - Goal: help you describe the data
  - reduce the amount of data necessary for understanding
  - don't draw conclusions -- "just the facts"
- Inferential:
  - Goal: draw conclusions from your sample to the larger data set (population)

184

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Measurement Scales

- Nominal
- Ordinal
- Interval
- Ratio

185

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Nominal Scale

- Nominal: Name or ID only
  - red, blue, green....
  - john, tony, fred...
  - Sci2-243, Sci2-245...
- does not signify Ordering, Ranking, or More/Less
- Gotcha: even if used with Numbers it may be still a Nominal.
- Example: colors, names, room numbers, ID numbers

186

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Ordinal Scale

- Ordinal : ordering
  - first, second, third....
  - 1, 2, 3...
  - A, B, C...
- signifies Order, but can't assume distance between items is the same, e.g. the difference between an A and a B may be much different than a B and a C
- Example: Class Rank, Assignment Grade, Product Ratings

187

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Interval Scale

- Interval: specifies orders AND inter-item distance
  - -3, -2, -1, 0, 1, 2, 3.... 100, 105, 115
  - the difference between two numbers IS the same, e.g. 100 to 105 should be the same amount as 105 to 110
  - Does NOT have an absolute zero.
- Example: temperature in Degrees Fahrenheit

188

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Ratio Scale

- Ratio: specifies orders AND inter-item distance and has absolute zero
  - 0, 1, 2, 3.... 100, 105, 115
  - the difference between two numbers IS the same, e.g. 100 to 105 should be the same amount as 105 to 110
  - Does have an absolute zero.
- Example: temperature in Degrees Kelvin

189

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Measurement Scales

	Magnitude	Equal Intervals	Absolute Zero
Nominal			
Ordinal	✓		
Interval	✓	✓	
Ratio	✓	✓	✓

190

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Scales: Practical Info

- Nominal Scale: common
  - common stats: Count, Frequency, Mode
- Ordinal Scale: less common
  - stats: specialized "nonparametric" techniques required
- Ratio and Interval: common
  - Often can be treated identically with same statistical techniques

191

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Descriptive Statistics

- Count (N)
- Range (minimum, maximum)
- Frequency Distribution (histogram)
- Rank order, percentile (%ile)
- Central Tendency
  - Mean
  - Median
  - Mode
- Variation / Dispersion (Variance, Standard Deviation)

192

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Population vs. Sample

- Ideally, measure *everyone* to get the exact value (*Population parameter*)
- Practically, this is impossible.
- Take samples instead, and calculate the *Sample statistic*.
- The “Law of Large Numbers”, “Sampling Theory”, “Central Limit Theorem” makes life easier
- [Central Limit Theorem Exercise \(Javascript\)](#)
- Some formulas differ for *Population* vs. *Sample* (divide by N or divide by N-1 ?)

193

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Population v. Sample

	Population	Sample
<b>Definition</b>	the entire set of items	the actual subset you measured
<b>Descriptives</b>	“Parameters”	“Statistics”
<b>Symbols</b>	Greek	Roman
<b>Mean</b>	$\mu$	$\bar{x}$
<b>Std. Deviation</b>	$\sigma$	S
<b>Variance</b>	$\sigma^2$	S <sup>2</sup>
<i>Divide by</i>	N	N-1

194

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Law of Large Numbers

- If you take enough\* samples, the sample mean approaches the population mean.
- Example: a coin has two sides. If heads=1 and tails = 0, then the average expected result is exactly 50% Heads (0.5) in the long run.
- However, if you flip a coin just a few times, getting exactly 0.5 is not likely.
- The LLN states that you will if you take enough samples.

\* what is “enough”? Rule of thumb : 100.

195

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## LLN Demonstration

- Law of Large Numbers
- [Demonstration with Coin Flips](#)

196

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Logical Fallacies

197

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Logical Arguments

- Logical arguments or inferences generally have several components:
  - Premises
  - Conclusions
- Example:
  - Premise: All English people are musicians
  - Premise: John Lennon was English
  - Conclusion: John Lennon was a musician

199

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Logical Arguments 2

- An Inference can be either Valid or Invalid -- this refers to the Structure of the argument (not the Facts themselves)
- All A are B  
All C are A  
All C are B
- A Valid inference can still come to a false conclusion, and vice-versa

200

Psychology 402 - Spring 2022 - Dr. Michael Dohr

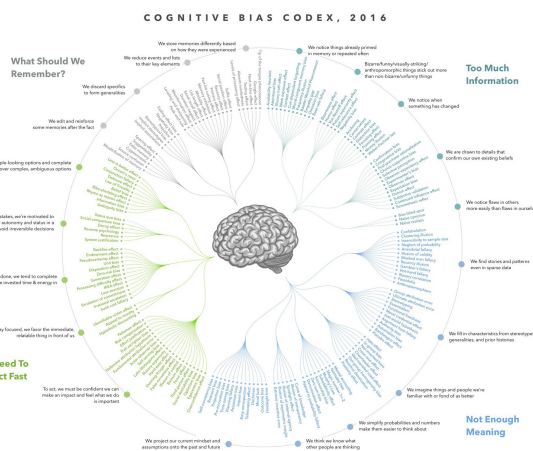

## Logical Fallacies

- A Logical Fallacy generally means that your inference is Invalid to begin with. In addition, your facts may or may not be true, but the flaw in reasoning has occurred before you even apply facts.
- Example: Affirming the consequent
- If P, then Q      bank owners are rich  
Q is true          Bill Gates is rich  
Therefore P      Bill Gates works at a bank

201

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Cognitive Bias Codex

Dr. Michael Dohr

## Biased Sample

- Every individual x that we have seen from sample X has characteristic Z  
Therefore ALL X have characteristic Z
- Every student I talk to in this class is interested in Psychology  
Therefore, ALL students are interested in Psychology

203

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Nominal and Numeric

- Nominal Fallacy: The tendency to believe that something has a name or identification, it exists or has special meaning. "I am sleepy" vs. "I am suffering from activity-induced-rest-reduction-performance-impairment syndrome"
- Numerical Fallacy: belief that something has been measured and assigned a number, it actually exists. "I'm really sad" vs. "I scored a 32 on the Beck Depression Inventory"

204

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Reification Fallacy

- To Reify - to make something more concrete or real
- Examples:
  - "An A student"
  - "High IQ"
  - "Top of the class"
  - "A F Grade"

205

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Ranking Fallacy

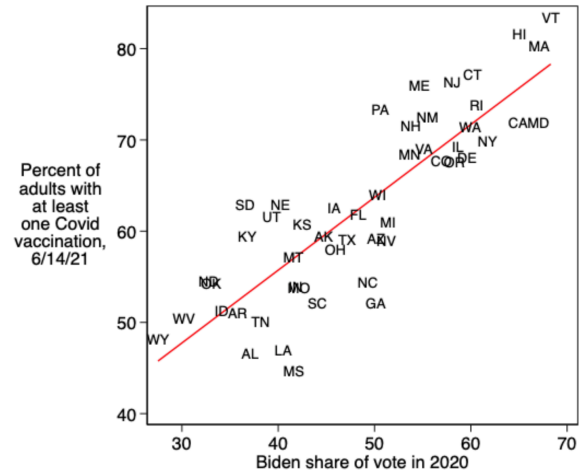

- Reducing a complex phenomenon (e.g. intelligence), giving it a single number (reification) and then ordering based on that number
- Examples:
  - A IQ of 93 is better than an IQ of 90
  - An income of \$50,000 is better than \$45,000

206

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Correlation = Causation

207

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Other Fallacies

- Begging the question -- circular argument
- Correlation implies causation
- Post hoc ergo propter hoc (*after* this, therefore *because* of this)
- Appeal to Authority
- Ad-hominem
- Straw Man
- False Dilemma

209

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Significant Figures

- “digits of precision” or “sig. fig.”
- Ignoring *leading zeros*, how many digits in the measurement?
  - 00123 has 3 sig. fig.
  - 12003 has 5 sig fig
  - 9.87 has 3 sig fig
  - 0.000987 has 3 sig. fig.
  - 12.1 has 3 sig. fig.
  - 12.0 has 3 sig. fig.
- Please use 3 sig fig for this class
- Note: not the same as “3 decimal places”

210

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Precision vs. Accuracy

- Precision : the level of detail a measurement is made with, often specified with an error-range
  - “about 6 feet plus or minus 1 foot” vs. “6 foot 11 inches plus or minus 1 inch”
- Accuracy: how close the measured value is to the actual value, does it “hit the target”
  - Think arrow vs. shotgun
- A number can be precise and accurate, precise but inaccurate, or accurate but imprecise.

211

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Precision Fallacy

- A number that is *precise* may seem to be *accurate* when it is not
- A measurement that is *reliable* may seem to have *validity* when it does not

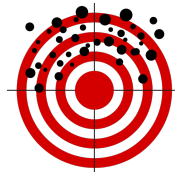

212

Psychology 402 - Spring 2022 - Dr. Michael Dohr

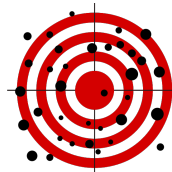

# Precision vs. Accuracy

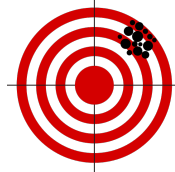

- Target shooting analogy
- Similar to Reliability vs. Validity

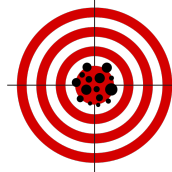

Unreliable &amp; Unvalid

Unreliable, But Valid

Reliable, Not Valid

Both Reliable &amp; Valid

## Fallacies re: Probability

- Classical
- Gambler's Fallacy
- Bayesian Reasoning

## 9 Heads in a row

- You are flipping a coin, and get 9 heads in a row  
H H H H H H H H H
- What is the % chance the next flip will be a H ?
- Three common answers:
  - 50/50
  - more likely Heads
  - more likely Tails

## 9 Heads: Classical Inference

- Coin flips are independent 50/50 events, therefore 50% : Logical/Statistical
- This is the *\*correct\** answer *for a fair coin*

## LLN Demonstration

- Law of Large Numbers
- Demonstration with Coin Flips

## 9 Heads: Gambler's Fallacy

- Coin flips are independent 50/50 events, but we just saw 9/10 heads, therefore a Tail is "due"
- This is the "Gambler's Fallacy" and one reason Casinos make tons of money. The reasoning is faulty.
- Note: when dealing with draws w/o replacement, this logic is *\*correct\**. For example, a single-card blackjack deck -- if no face cards have come up after 30 cards, then face cards are due

## 9 Heads: Bayesian Statistics

- Coin flips are supposed to be 50/50 events, but we just saw 9/10 heads, therefore the data is telling us that perhaps this is not a fair coin.
- Bayes' theorem suggests you evaluate the prior probabilities in determining future behavior
- In this case, you'd conclude that Head is more likely on the next flip

219

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Cognitive Biases of Discrimination

- Which cognitive biases (logical fallacies) are involved in racism, sexism and other bigoted beliefs?

220

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Ch. 2 - Part 3

224

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Review - History

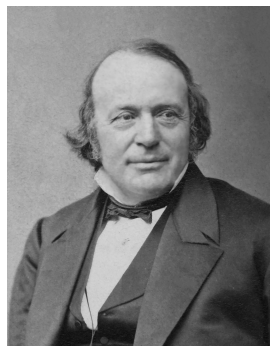

- Themes
  - 18th-19th century
  - 19th-20th century
- Theories of Human Development
  - Creationism
  - Polygenism
  - Evolution
  - Genetics
- Controversy
  - IQ testing of various groups

228

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Louis Agassiz

- Swiss-born, European-trained biologist / geologist
- Came to Harvard in 1847
- Creationist -> Polygenist
- Taxonomist
- Resisted Darwin's theory of Evolution
- d. 1873

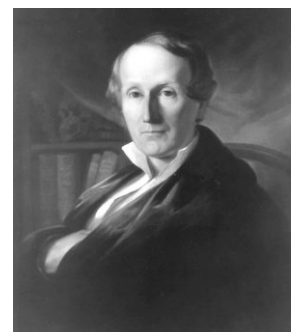

229

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Review: Samuel George Morton

- Theory of Polygenism
  - Humans are composed of different species, created by god
- Craniometry
- Biological Determinism
- "Scientific Racism"
- The "American School"
- d. 1851

230

Psychology 402 - Spring 2022 - Dr. Michael Dohr

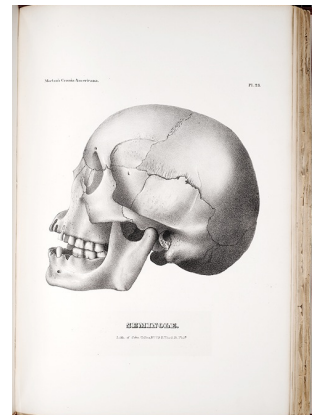

## Fallacies?

- “...the aboriginal races, with few exceptions, have perished or constantly receded, before the Anglo-Saxon race, and in no instance either mingled with them as equals, or adopted their manners and civilization. These phenomena [must be] connected with a difference in the brain between the native American race, and their conquering invaders” (Combe & Coates, as cited in Gould, p. 83-84)
- drapetomania* - the insane desire to run away and escape from slavery (Cartwright, p. 103)

231

Psychology 402 - Spring 2022 - Dr. Michael Deahr

## Crania Americana

Samuel George Morton  
1839

232

Psychology 402 - Spring 2022 - Dr. Michael Deahr

234

Psychology 402 - Spring 2022 - Dr. Michael Deahr

## Morton's Data as printed

Race	N	Cranial Volume Mean
Caucasian	52	87
Mongolian	10	83
American	144	82
Malay	18	81
Ethiopian	29	78

235

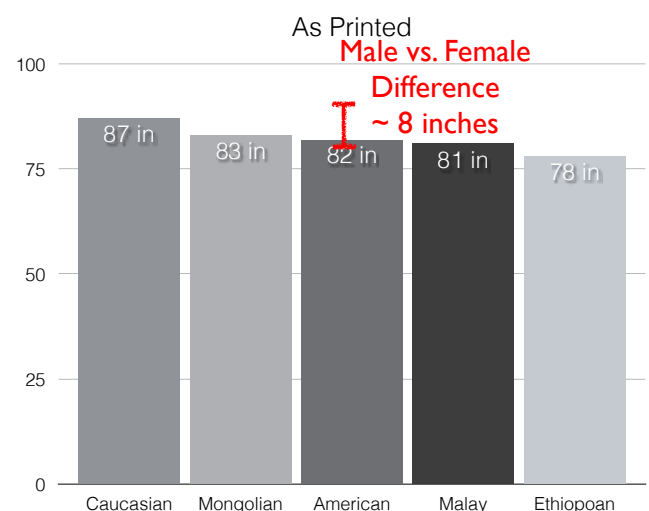

Psychology 402 - Spring 2022 - Dr. Michael Deahr

## Data, corrected

Race	Mean (Morton)	Mean (corrected)
Caucasian	87	87
Mongolian	83	87
American	82	86
Malay	81	85
Ethiopian	78	83

236

Psychology 402 - Spring 2022 - Dr. Michael Deahr

237

Psychology 402 - Spring 2022 - Dr. Michael Deahr

## Seed vs. Shot

Race	Difference (seed - shot)
Caucasian	1.8
Mongolian	n/a
American	2.2
Malay	n/a
Ethiopian	5.4

238

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Morton's errors

- Fundamental arithmetic errors
- Data selection errors
- Failure to measure or control for external variables (biological sex, body size, etc.)
- Basic Statistical errors (averaging measurements from unequal size subgroups)
- The racist thumb press?
- Is he a liar? Conscious or subconscious?

239

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Morton's Model

240

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Internal vs. External Validity

- Internal Validity - how did it work?
  - were the methods good
  - did the IV cause the DV
- External Validity - what does it mean?
  - does skull size indicate IQ?
  - does IQ indicate personal worth?

241

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Is skull size related to IQ?

- Yes. No. Maybe? Probably not much.
- Correlation between IQ and brain size:  $R = 0.24$  (Pietschnig, 2015)
- $R^2 = \sim 6\%$  which means 94% of variance is *not explained*
- Thus, observed 3-4 cubic inch difference between the races would account for, *at most*, a 2-3 point IQ difference.
- But... men have  $\sim 10\%$  larger brains than women, but do not show higher IQ (more on this later)

242

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Comparing Scores

- Compare a single score to the population
- One way: difference scores
- Problem: Is a difference of "3" big or little? On a 100 point test it's not very large, but on a 10 point test it's the difference between an A and a C

243

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Comparing Scores

- Desire a system independent of the raw score units (just like letter grades)
- Two methods:
  - Ranks & Percentile Ranks...
  - Standard Scores...

244

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Ranks, Percentiles

- Given a distribution of scores, and a single score
- **Rank** = the item # of the single score when sorted high to low
- **Percentile Rank** = the % of scores which are lower than the given score
- **Percentile** = the score at which a given percent of scores are below a given score
- Note: “Percentile” often used informally to mean “Percentile Rank”

245

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Rank & Percentile

- Coronavirus Deaths
- Total deaths, per million people, as of September 2020
- Sort low to high

Country	Score
Mozambique	0.9
China	3.0
Ethiopia	8.0
Japan	11.0
Zambia	16.0
Colombia	424.0
France	471.0
Sweden	577.0
USA	584.0
Bolivia	599.0

247

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Rank & Percentile

- Determine Rank #

Country	Score	Rank
Mozambique	0.9	1
China	3.0	2
Ethiopia	8.0	3
Japan	11.0	4
Zambia	16.0	5
Colombia	424.0	6
France	471.0	7
Sweden	577.0	8
USA	584.0	9
Bolivia	599.0	10

248

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Percentile Rank

Percentile Rank = # of cases with worse value divided by # of cases

e.g. France is 7th of 10 (it has 3 cases with worse values)  
 $3 / 10 = 30\%$   
 percentile rank

Country	Score	Rank	%ile Rank
Mozambique	0.9	1	90
China	3.0	2	80
Ethiopia	8.0	3	70
Japan	11.0	4	60
Zambia	16.0	5	50
Colombia	424.0	6	40
France	471.0	7	30
Sweden	577.0	8	20
USA	584.0	9	10
Bolivia	599.0	10	0

249

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Standard Scores 2

- Use the mean and standard deviation as points of reference.
- Standard score : distance from the mean, scaled by standard deviation
- Not affected by raw score units.
- Different standard scores mean the same thing, but are expressed differently.
  - just like how 1.0 and 100% mean the same thing
- Unfortunately, there are several different Standard Score systems!

250

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Z-score

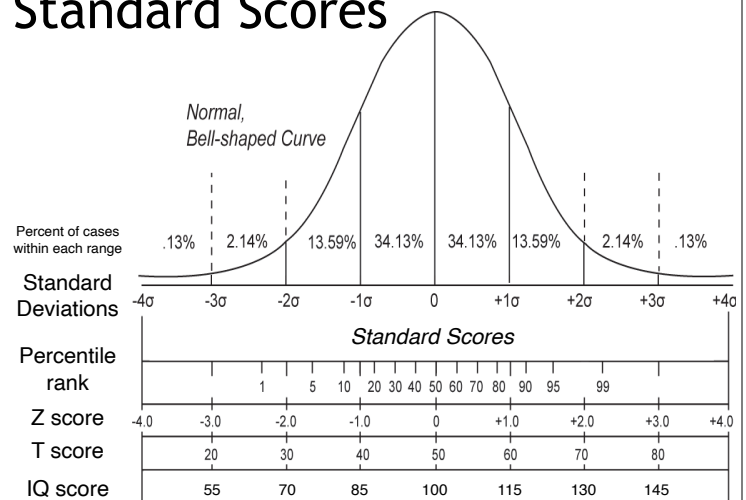

- A Z score is the # of standard deviations above (+) or below (-) the mean of a single measurement.
- Algorithm: given a single score ( $X_i$ ), subtract the mean  $M$ , divide by the standard deviation  $S$
- Formula
  - $Z = (X-M)/SD$

$$Z_i = \frac{X_i - \bar{X}}{S}$$

252

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Standard Scores

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Standard Scores: Z, T, IQ

	Z scores	T scores	IQ scores
Mean	0	50	100
SD	1	10	15
Example: top 3%			
Example: top 1%			
Formula: from Z Score	Z	$(Z \cdot 10) + 50$	$(Z \cdot 15) + 100$

254

Psychology 402 - Spring 2022 - Dr. Michael Dohr

z-Score $(x - \bar{x})/s$	T-Score $10z + 50$	Wechsler IQ $(15z + 100)$	Percentile Rank
3.0	80	145	99.9
2.9	79	144	99.8
2.8	78	142	99.7
2.7	77	141	99.6
2.6	76	139	99.5
2.5	75	138	99.4
2.4	74	136	99.2
2.3	73	135	98.9
2.2	72	133	98.6
2.1	71	132	98.2
2.0	70	130	97.7
1.9	69	129	97.1

255

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Norms 1

- Standard Scores provide us with a way of describing how a particular score relates to others in the population.
- Describing how an individual score relates to the population, which we assume are “normal”.
- Terms “normative data” and “norms”
- Key questions: What is the normative group? What features or factors of the group may affect scores?

256

Psychology 402 - Spring 2022 - Dr. Michael Dohr

## Norms 2

- “norm-referenced” tests vs. “criterion-referenced” tests.  
Example: an 85 year old in excellent shape could be in the top 5% of his class for firefighting ability, but this may still be a “failing” grade.
- Common factors that may matter:
- Gender, Age, Education, Ethnicity/Race, Language, Handedness, Height, Weight...

257

Psychology 402 - Spring 2022 - Dr. Michael Dohr

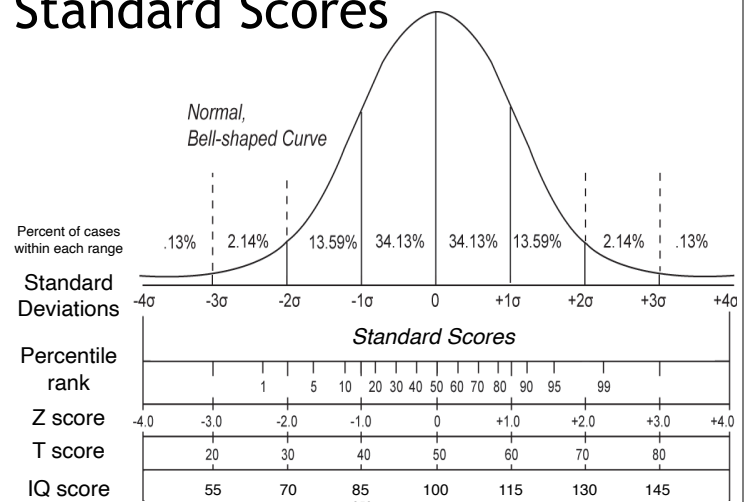

# Z-score Exercise

- This is for practice, not graded for points
- PDF is on class website

258

Psychology 402 - Spring 2022 - Dr. Michael Dohr

# Standard Scores

Psychology 402 - Spring 2022 - Dr. Michael Dohr

# Standard Scores: Z, T, IQ

	Z scores	T scores	IQ scores
Mean	0	50	100
SD	1	10	15
Example: top 3%	1.9		
Example: top 1%	2.4		
Formula to convert from Z Score	Z	$(Z \times 10) + 50$	$(Z \times 15) + 100$

260

Psychology 402 - Spring 2022 - Dr. Michael Dohr
