- $X$  = Observed
- $E$  = Error
- $X = T+E$
- $E = X-T$

## 4 Kinds of Reliability

	Description	Name	Statistic
Time Sampling	1 test given two times	test-retest reliability	correlation between scores at two times
Item Sampling	2 different tests given once	Alternate or Parallel forms	correlation between scores on 2 versions
Internal Consistency	One test, multiple items	Split Half or internal reliability	Cronbach's Alpha
Observer Differences	One test w/ 2+ observers	inter-observer reliability	Kappa

## 4 Kinds of Validity

	Description	Notes	Statistic(s)
<b>Face</b>	do items "look" valid?	informal, improper, non-scientific	none
<b>Content</b>	do test questions cover the topic?	logic & expert judgement	none
<b>Criterion</b>	does the test predict a specific outcome?	requires a well-defined criterion	Pearson's R (correlation) between Test and Criterion
<b>Construct</b>	does the test measure what it claims	modern theory: all validity is Construct validity	Convergent and Divergent correlations (Pearson's R)
